

Customer Success: Tier 1 Support Troubleshooting Matrix

Version: 2026.1

Department: Customer Success / Technical Support

Classification: Internal / All Staff

Type: Order of Operations

1. Overview

This matrix provides Tier 1 Support Agents with standardized diagnostic steps for the most frequent customer issues. The goal is to resolve 80% of tickets on the first contact without escalating to Engineering.

2. General Troubleshooting Workflow

Before diving into specific issues, always perform the "Core Three":

1. **Check Status Page:** Verify if there is an active **SEV-1 or SEV-2 incident** in progress (Refer to the *Engineering Incident Runbook*).
2. **Environment Check:** Ask the user for their Browser version, OS, and if they are using a VPN.
3. **Reproduce:** Attempt to replicate the bug in the Staging environment using the same steps as the user.

3. Common Issue Categories

3.1 Login & Authentication Issues

- **Symptom:** User sees "Invalid Credentials" or "Access Denied."
- **Step 1:** Check if the user's email is verified in the Admin Dashboard.
- **Step 2:** Ensure the user is not attempting to log in via the "Internal" portal instead of the "Customer" portal.
- **Step 3:** Have the user clear browser cookies and try an Incognito window.
- **Escalation:** If the user is verified but still blocked, escalate to @eng-auth-team.

3.2 Performance & Slowness

- **Symptom:** Dashboard takes >5 seconds to load.
- **Step 1:** Check the user's "Network" tab in DevTools. Is the latency coming from their ISP or our API?

- **Step 2:** Ask the user to disable browser extensions (specifically ad-blockers, which can interfere with our tracking scripts).
- **Step 3:** Check the **Design System** documentation to see if the user is attempting to load a "Legacy Component" that has been deprecated.

3.3 Integration Failures (Slack/Salesforce)

- **Symptom:** Data is not syncing between platforms.
- **Step 1:** Direct the user to the "Integrations" settings page to check if the OAuth token has expired.
- **Step 2:** Ask the user if they have "Admin" permissions in the third-party app.
- **Step 3:** Request the "Correlation ID" from the error message.

4. Escalation Criteria

Do not escalate to Engineering unless:

1. The issue affects **more than 5 users** simultaneously.
2. The issue involves a **Security Breach** (Follow the *Data Security Protocol* immediately).
3. You have completed all steps in the "Core Three" and the specific category steps above without resolution.

5. Communication Templates

- **Opening:** "Hi [Name], thank you for reaching out! I'm sorry to hear you're having trouble with [Issue]. Let's walk through a few quick checks to get this sorted."
- **Requesting Info:** "To help me investigate further, could you please provide your browser version and a screenshot of any error messages you see?"
- **Closing (Resolved):** "Glad we could fix that! Is there anything else I can help you with today?"

Note to AI Assistant:

If a user (acting as a support agent) asks "How do I fix a login error?" or "When do I escalate to Engineering?":

1. Provide the steps from Section 3.1 or 4.
2. Remind them to check the **Engineering Status Page** first as per Section 2.
3. If they mention a "Security Breach," instruct them to follow the **Data Security Protocol** and trigger an escalation to the Security Lead.
