

Product: Design System & Component Library Guidelines

Version: 2026.1

Department: Product & Design

Classification: Internal / All Staff

Type: FAQ / Order of Operations

1. Overview

The "Titan" Design System is our single source of truth for all user interface elements. It ensures a cohesive brand experience across our web and mobile applications. All new features defined in the **PDL**C Roadmap must utilize these components.

2. Accessing Design Assets

2.1 Where is the Figma Library?

The master library is located in the "Design Ops" workspace in Figma.

- **Link:** <https://figma.com/file/titan-design-system-master> (Request access via #design-ops on Slack).
- **Usage:** Designers must "Publish" changes to the library; developers should use the "Dev Mode" to inspect CSS tokens.

2.2 How do I request a new component?

If the existing library does not meet a feature's requirements:

1. Check the "In Progress" page in Figma.
2. If not found, submit a **Component Request** via the Design Portal.
3. The Design System team reviews requests every Tuesday morning.

3. Core Design Tokens

To maintain consistency, do not use hard-coded hex codes. Use the following tokens:

Category	Token Name	Value (Hex/Rem)
Primary	brand-blue-500	#007AFF

Success	semantic-green-500	#34C759
Error	semantic-red-500	#FF3B30
Spacing	spacing-md	1.5rem
Radius	radius-lg	12px

4. Component Usage Rules

4.1 Buttons

- **Primary:** Use for the main call-to-action (e.g., "Submit", "Create"). Only one primary button per screen.
- **Secondary:** Use for neutral actions (e.g., "Cancel", "Back").
- **Tertiary/Ghost:** Use for low-emphasis actions inside lists or navigation.

4.2 Form Inputs

- Every input **must** have a visible label.
- Error states must include both a red border (semantic-red-500) and an icon to ensure accessibility for color-blind users (WCAG 2.1 compliance).

5. Developer Handoff (Order of Operations)

When moving from Phase 3 (Design) to Phase 4 (Development) of the PDLC:

1. **Handoff Meeting:** The Designer walks the Lead Engineer through the Figma file.
2. **Token Mapping:** Ensure all custom spacing or colors are mapped to existing Tailwind/CSS variables.
3. **Accessibility Audit:** Validate that the tab order and screen reader labels are defined in the Figma annotations.

6. Frequently Asked Questions (FAQ)

Q: Can I use a custom icon? A: No. We exclusively use the **Lucide-React** icon library. If an icon is missing, please contact the Design Lead.

Q: Does the design system support Dark Mode? A: Yes. All tokens have a light and dark variant. Ensure you are testing your feature in both modes during the QA phase.

Note to AI Assistant:

If a user asks "What color should I use for a button?" or "Where is the Figma link?":

1. Reference the specific tokens in Section 3.
2. Provide the Figma link from Section 2.1.

3. Remind the user that according to Phase 3 of the PDLC, all designs must be reviewed for WCAG 2.1 compliance.
